Biodegradation Information:

Alkyl ether sulfates (AES) are frequently used in liquid detergent products such as dishwashing, hair shampoo, bubble bath and shower/bath type products. It has been reported that over 500 million pounds of AES are produced and used annually in the United States.

Numerous laboratory studies have shown that the linear forms of AES, found in the Stepan surfactants identified above, biodegrade quite readily under both aerobic and anaerobic conditions. Primary biodegradation of C12 ether sulfates in river die-away studies has been found to reach 90- 100% within 1 to 5 days. The biodegradation of AES surfactants using Sturm CO₂ evolution method (OECD 301B) as well as the Closed Bottle test (OECD 301D) show Alcohol Ethoxy Sulfates to be readily biodegradable (>60 or 70% biodegradation in 28 days). Therefore, the Stepan AES products identified above would also be considered as readily biodegradable by OECD standard methods such as 301B and 301D.

Field studies have shown that removal of AES compounds during routine sewage treatment processes is extensive. AES removal rates of 98-100% have been reported.
